Puzzle Corner:

a. $\triangle + \triangle = 6$ $\square + \triangle = 8$ Since two triangles equal 6, then one triangle must equal 3. Then, since $\square + \triangle = 8$, and the triangle is 3, the square must equal 5. $\triangle = \underline{3} \quad \square = \underline{5}$	b. $\square + \triangle = 7$ $\square + \square = 10$ Since two squares equal 10, then one square must equal 5. Then, since $\square + \triangle = 7$, and the square is 5, the triangle must be 2. $\square = \underline{5} \quad \triangle = \underline{2}$	c. $\square + \triangle + \triangle = 7$ $\square + \triangle = 5$ The first equation, $\square + \triangle + \triangle = 7$, contains $\square + \triangle$ which we know equals 5. So: $\begin{aligned} &\square + \triangle + \triangle \\ &= (\square + \triangle) + \triangle \\ &= 5 + \triangle \end{aligned}$ The first equation is therefore the same as $5 + \triangle = 7$. From that, a triangle is 2. Using the second equation, knowing that a triangle is 2, we can solve that a square is 3. $\triangle = \underline{2} \quad \square = \underline{3}$
